

Problem K

Deck-Building Game

You are playing a deck-building game with your friend. There are N cards, numbered from 1 to N . Card i has the value of A_i .

You want to build two decks; one for you and one for your friend. A card cannot be inside both decks, and it is allowed to not use all N cards. It is also allowed for a deck to be empty, i.e. does not contain any cards.

The **power** of a deck is represented as the bitwise XOR of the value of the cards in the deck. The power of an empty deck is 0.

The game is **balanced** if both decks have the same power.

Determine the number of ways to build two decks such that the game is balanced. Two ways are considered different if one of the decks contains at least one different card. Since the answer can be very large, calculate the answer modulo 998 244 353.

Input

The first line consists of an integer N ($2 \leq N \leq 100\,000$).

The following line consists of N integers A_i ($1 \leq A_i \leq 100\,000$).

Output

Output an integer representing the number of ways to build two decks such that the game is balanced. Output the answer modulo 998 244 353.

Sample Input #1

```
4
16 12 4 8
```

Sample Output #1

```
9
```

Explanation for the sample input/output #1

Denote S and T as the set of cards in your deck and your friend's deck, respectively. There are 9 ways to build the decks such that the game is balanced.

- $S = \{\}$ and $T = \{\}$. Both decks have the power of 0.
- $S = \{2, 3, 4\}$ and $T = \{\}$. Both decks have the power of 0.
- $S = \{\}$ and $T = \{2, 3, 4\}$. Both decks have the power of 0.
- $S = \{2, 4\}$ and $T = \{3\}$. Both decks have the power of 4.

- $S = \{3\}$ and $T = \{2, 4\}$. Both decks have the power of 4.
- $S = \{2, 3\}$ and $T = \{4\}$. Both decks have the power of 8.
- $S = \{4\}$ and $T = \{2, 3\}$. Both decks have the power of 8.
- $S = \{3, 4\}$ and $T = \{2\}$. Both decks have the power of 12.
- $S = \{2\}$ and $T = \{3, 4\}$. Both decks have the power of 12.

Sample Input #2

```
4
1 2 4 8
```

Sample Output #2

```
1
```

Explanation for the sample input/output #2

The only way to make the game balanced is to have both decks empty.

Sample Input #3

```
2
1 1
```

Sample Output #3

```
5
```

Explanation for the sample input/output #3

There are 5 ways to build the decks such that the game is balanced.

- $S = \{\}$ and $T = \{\}$. Both decks have the power of 0.
- $S = \{1, 2\}$ and $T = \{\}$. Both decks have the power of 0.
- $S = \{\}$ and $T = \{1, 2\}$. Both decks have the power of 0.
- $S = \{1\}$ and $T = \{2\}$. Both decks have the power of 1.
- $S = \{2\}$ and $T = \{1\}$. Both decks have the power of 1.

Sample Input #4

```
6
1 1 1 2 2 2
```

Sample Output #4

```
169
```
